

Ok, now lets take things to the very top. Starting with the ISA on the EDI side of things. Ok, this stuff is pretty boring. If you want to understand what every segment for ISA is, here is a doc that explains some of it <http://miscouncil.org/committees/standards/interchg.pdf> (You can find this by Googling ISA interchange control header.)

The first challenge I had to overcome was dealing with FI12 and F28 in other words the Interchange control number and the group control number. According to above interchg.pdf these numbers uniquely identify the interchange and are assigned by the sender and, it is suggested that the sender, receiver, and all third parties be able to maintain an audit trail of interchanges using this number. I was hoping that TrustedLink for Windows would generate this for me but, since I was bypassing its overlay layer and doing an EDI import, I needed to generate this myself. So lets generate these control numbers.

<b>Input / Output File</b> <div style="display: flex; justify-content: space-between; align-items: flex-start;"> <div style="width: 60%;"> <input style="width: 95%;" type="text" value="C:\ControlNBR.txt"/>  <input style="width: 95%;" type="text"/> </div> <div style="width: 35%; text-align: center;"> <input type="button" value="Input file"/>   <input type="button" value="Output file"/> </div> </div>		<input type="button" value="OK"/>  <input type="button" value="Cancel"/>							
<b>Input / Output Encoding</b> <div style="display: flex; justify-content: space-between; align-items: flex-start;"> <div style="width: 70%;"> <p>Encoding name: <input style="width: 90%;" type="text" value="Unicode UTF-8"/></p> <p>Byte order: <input style="width: 80%;" type="text" value="Little Endian"/></p> </div> <div style="width: 30%; text-align: center;"> <input type="checkbox"/> Include byte order mark         </div> </div>									
<b>CSV Settings</b> <div style="display: flex; justify-content: space-between; align-items: flex-start;"> <div style="width: 60%;"> <p>Field delimiter</p> <div style="display: flex; align-items: center;"> <input type="radio"/> Tab           <input type="radio"/> Semicolon           <input checked="" type="radio"/> Comma           <input type="radio"/> Space           <input type="radio"/> Custom <input style="width: 40px;" type="text"/> </div> </div> <div style="width: 35%;"> <p>Text enclosed in</p> <div style="display: flex; align-items: center;"> <input type="radio"/> Not           <input type="radio"/> '           <input checked="" type="radio"/> "         </div> </div> </div> <div style="margin-top: 10px;"> <input type="checkbox"/> First row contains field names  <input checked="" type="checkbox"/> Treat empty fields as absent         </div>									
<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr style="background-color: yellow;"> <th style="text-align: left; padding: 2px;">ISA Control</th> </tr> </thead> <tbody> <tr style="background-color: yellow;"> <td style="padding: 2px;">string</td> </tr> <tr> <td style="padding: 2px;">51</td> </tr> <tr> <td style="height: 40px;"></td> </tr> </tbody> </table>	ISA Control	string	51		<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr style="background-color: yellow;"> <th style="text-align: left; padding: 2px;">GS Control</th> </tr> </thead> <tbody> <tr style="background-color: yellow;"> <td style="padding: 2px;">string</td> </tr> <tr> <td style="padding: 2px;">51</td> </tr> <tr> <td style="height: 40px;"></td> </tr> </tbody> </table>	GS Control	string	51	
ISA Control									
string									
51									
GS Control									
string									
51									
<div style="display: flex; justify-content: space-around; align-items: center;"> <input type="button" value="Append Field"/> <input type="button" value="Insert Field"/> <input type="button" value="Remove Field"/> <div style="display: flex; gap: 10px;"> <input type="button" value="←"/> <input type="button" value="→"/> </div> </div>									

Every time the code runs we want it to add one to the values in the controlNBR.txt file. So lets create two add functions and then a constant of the number 1 which we will connect to the value 2 of those functions. Now let's

insert another text file, this time for the output. Choose simple processing mode and choose that same controlNBR.txt we used for our input.

Input / Output File

Input file:

Output file:

Input / Output Encoding

Encoding name:

Byte order:  ☐ Include byte order mark

CSV Settings

Field delimiter: ☐ Tab ☐ Semicolon ☒ Comma ☐ Space ☐ Custom

Text enclosed in: ☐ Not ☐ ' ☒ "

☐ First row contains field names

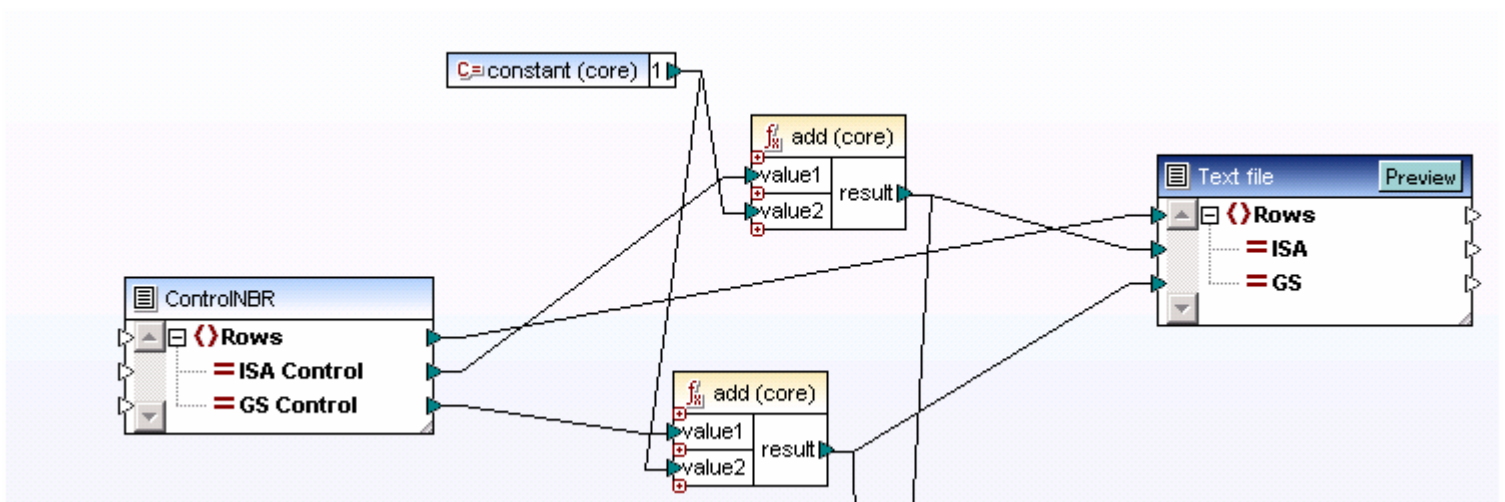

☒ Treat empty fields as absent

☒ CSV ☐ Fixed

ISA string GS string

Click the append field to add another field and name them ISA and GS. (Notice how the output file is set) When you export the code it will give you a warning that you are overwriting a file, which is OK, because that's what we want.

Now connect ISA Control to an Add function and create a constant of 1 and connect it to value 2. Now connect the result to ISA in the output file. Do the exact same thing for the GS Control. It will look something like this.

Also you will notice two lines going downwards. Connect the result of the add function for your ISA Control to FI12 and the result of your add from the GS Control to F28. You won't see the results of this adding one to the control numbers until you actually export the code and compile and execute it, which sounds like a good topic for section three of this guide.
